

Feedback:

Matt - Viz 1... Nice plot honestly, I would just try and make the text bigger and fix the Michigan issue. Plot 2... I love the coloring, labeling, it may be useful to include trendline stats... does this trendline really correlate? How well? How does the coloring aid our understanding? May be trying to represent too many things.

Mikel: For the choropleth, as was mentioned for a different group member's plot, it could be of interest to add an annotation to the highest and lowest counties to give the viewer a better reference point (like we discussed in data narratives and reader-driven vs. author-driven narratives)

Jaini - I like the addition of text to the scatter plot. Adding in a black line around each of the states to differentiate between them. What is the main point of the second visualization? Hard to understand. Maybe reduce the number of datapoints or use subplots to differentiate income levels so they are easy to differentiate.

Purvi - Need 2 more plots, also I think for plot 1 it's better to make it interactive if not interactive, then it's better to mark the country with high or low food access with percentage. I guess it would be good if you consider only certain parameters for plot 2, its difficult to figure out what the conclusion is from the plot 2

My thoughts:

Some of the issues I am having are still finalizing my questions overall, so it best assesses the dataset that I'm using. The group liked my color scheme, and suggested I keep it for my future visualizations since I will continue to subgroup income levels which having a set color scheme will be useful for the understanding for the project audience. I definitely plan to add state lines to my choropleth map, the issue i had originally is that the data is set as counties and not as state. I also need to work on my second plot, which may have too many datapoints since there is so many counties in the usa, I may create four different graphs in one so i can better tell the differences between each population type. I also need to look at the trend line in that graph and see if it is necessary and makes sense. Overall, my graph drafts were pretty good, and i just need to create my last ones.
