

Commentary -

- 1) Matt: This webpage is very attractive, I would go through what you said and clarify your findings and then determine one main argument... focus on the economic factors. If you want to keep a webpage, maybe make some of these interactive. I think the most convincing one to make that way or make an animation... maybe your map. You could cycle between say poverty rate per county and food access so we can see the correlation instead of you just telling us. The font choices are great, and the sense of hierarchy and importance is good too. You are on the right track with this project.
- 2) Purvi - I guess there is quite unnecessary heading and footers with some discrepancy in font colour in second page . I really like graph but i think they just need to be arranged in proper manner to tell a story .It seems the data is all over without a real argument. Apart from that great work with creativity.
- 3) Mikel: I like the setup as a scrollable website style. My only point of recommendation was to solidify your argument. At the top you state how zip code determines your health, but then the one figure is focused on income. While the two are related, they aren't the same and it would probably be more clear if you refined your title/hook.
- 4) Jaini: I would change the title of the webpage to something more suitable to the actual conclusion of the presentation. I would also switch up figure 3 and 4 because figure 3 seems to be the highlight so I would end with that. I do like how you have summary stats at the top of the page. Overall I think it looks very clean and visually appealing.

The overall design and visual presentation are working well like the font choices, hierarchy, summary stats, and scrollable layout all received positive feedback. The main issue flagged across the board is that the project looks polished but doesn't yet feel like it's making a single convincing argument. The figures feel scattered rather than building toward a conclusion, and the title "your zip code determines your diet" creates a disconnect when the visualizations lean heavily on income data, zip code and income are related, but they aren't the same thing, so either the title or the figures need to be brought into alignment.

The story flow and structure need the most attention before the final submission. The strongest visualization should be saved for last to land as the climax rather than sitting in the middle, and the figures should be reordered so each one builds on the previous. The map was specifically highlighted as a strong candidate for interactivity, animating it to cycle between poverty rate and food access per county would let the audience see the correlation themselves rather than just being told about it, which would go a long way toward making the argument feel inevitable. A few small cleanups, unnecessary headers and footers, and a font color inconsistency on the second page, are also worth addressing.
